

ABSTRACT OF THE DISCLOSURE

An apparatus according to the present invention is a cellular IP modem that includes a baseband-to-intermediate frequency unit and a radio frequency unit. The baseband-to-intermediate frequency unit is configured to have a routing engine based
5 on Cellular Internet Protocol. A method according to the present invention includes the steps of sending a data packet including routing information indicating an intermediate recipient other than a base station; receiving the packet at the intermediate recipient; and sending the packet in accordance with the routing information from the intermediate recipient to the base station. Additionally, a network architecture is
10 described to support the creation of the Cellular IP network and its elements.
